

```
models = ['Viola-Jones', 'Deep Learning']
accuracy = [80, 95]
speed = [95, 60] # higher = faster (relative)

import matplotlib.pyplot as plt

plt.figure()
plt.bar(models, accuracy)
plt.axhline(y=85, linestyle='--')
plt.title("Accuracy Comparison")
plt.show()

print("Constraint: Accuracy >= 85 & Real-time")

for i in range(len(models)):
    if accuracy[i] >= 85:
        print(models[i], "✓ Accuracy OK")
    else:
        print(models[i], "✗ Accuracy FAIL")

print("\nDecision: Use Optimized Deep Learning")
```

Constraint: Accuracy ≥ 85 & Real-time

Viola-Jones ✗ Accuracy FAIL

Deep Learning ✓ Accuracy OK

Decision: Use Optimized Deep Learning
